

To whom it may concern:

Lamp's Field fabricated trusses are capable of being fabricated and erected as single piece trusses, rather than fabricated and erected in pieces. Their single piece trusses are quicker to erect than multiple piece trusses and require less horizontal chord bracing. Field fabricated trusses are fabricated in jigs and meet or exceed the quality of shop fabricated trusses. Shop fabricated trusses often experience damage during shipping and handling. This is not an issue with Lamp's field fabricated trusses. Rather than waiting for shop fabricated trusses to arrive at the project site, field fabricated trusses can be erected as soon as the trusses have been fabricated. This can result in shorter overall truss fabrication and erection times for field fabricated trusses. Field fabricated trusses are in compliance with building codes and industry standards.

Sincerely,

Phillip M. Esswein, P.E.
